

More Proof SpaceX is a Fraud

by Miles Mathis

June 23, 2024

[See this article that came out today](#), which admits SpaceX is the only company and the US the only country supposedly reusing rockets, landing them backwards on floating barges. China, which has allegedly landed things on the Moon, has never even tried to land or reuse a rocket. How likely does that sound to you? HASN'T EVEN TRIED.

Have you considered the possibility that is because SpaceX is the only company with enough cohones to . . . **sell you CGI as real**? They figure the American audience is so dense as a matter of science and physics they will buy rockets landing backwards on little lily pads out in the water, not realizing that these are just Hollywood computer graphics like they used in *Star Wars*, created by running films in reverse. Take a video of a launch and run it is reverse: voila, you have a landing.

Plus, this is China we are talking about. SpaceX allegedly started landing rockets almost a decade ago, and normally China can copy anything we do within a matter of months, doing it for 1/10th the cost. But a decade later THEY AREN'T EVEN TRYING to trying to steal this tech from us? How believable is that? They aren't trying because they don't think they can get it past their own people. Asians are good at math and science, remember? They wouldn't buy this conjob.

Yeah Cloudypants, it IS crazy and nuts that SpaceX would sell CGI as real like that, and that some people would believe it. It is nuts that people are so stupid they think that rockets can fly and land backwards, and that they can watch those obviously fake videos and not catch on, and that Musk can say tongue-in-cheek “the faker it looks the realer it is” and people still don't catch on.

Addendum June 26: a reader [just sent me a correction to this](#), telling me China has tested reusable rockets:

The screenshot shows a news article on the SpaceNews website. The article title is "China's state-owned SAST performs reusable rocket test" by Andrew Jones, dated June 24, 2024. The main image shows a rocket launch from a desert landscape. Below the image, there is a caption: "A SAST test article during a VTVL reusable rocket test, June 23, 2024. Credit: CASG". The article text includes: "HELSINKI — SAST has conducted China's highest altitude launch and landing test so far as the country chases reusable rocket capabilities." and "A 3.8-meter-diameter test article powered by three methane-liquid oxygen engines lifted off from the Gobi Desert June 23, the Shanghai Academy of Spaceflight Technology (SAST) announced." On the right side, there is a sidebar for "Upcoming Events" with two items: "Masterclass: Raising Money as a Hot Tech Startup" on June 27 and "Ocean Space Forum" on June 2.

One little problem: check out the dates there. The test was allegedly June 23 and the report was June 24. I remind you that I wrote this paper June 23 and Cloudypants posted his tweet June 22. So China sure put that together fast in response to us, eh? But CGI doesn't take too long, you know.

Also notice that it says a 3.8 meter diameter “test article” lifted off. What? Since when is a rocket an article? Looks like this was written by AI and they goofed it.
