

# TOOTHPASTE? ASK YOUR DOCTOR!

*by Miles Mathis*

*August 25, 2024*

So I'm at the pub. Yes, pub. We can call them that here in the States. Pub. Doesn't require a British birth certificate to call it a pub instead of a bar. You have heard of pub crawls, right? They even have a pub run in San Antonio, Texas. I have been on it. San Antonio and Texas are not exactly cosmopolitan hotspots, with guys in ascots and women with Wimbledon parasols driving Bentleys. So if they know what a pub is there, I think I can use the word without being called a pretender.

Anyway, I was at the pub and I overheard this lady talking about getting a prescription for hand lotion from her doctor. She was telling her friend her hands were *so* dry. I almost ejected my suds in a spit take. A prescription for hand lotion? How much did that cost her? Let me guess: \$100 for the lotion and another \$200 for the doctor's visit? What's next, a prescription for toothpaste?

TOOTHPASTE.\* ASK YOUR DOCTOR!

Gee, doc, my teeth are all slimy in the morning. Am I dying?

No, no, relax. You just need a tube of this AI nanoparticle toothpaste from Pfizer. Use it twice a day for three months and make an appointment for a series of follow-ups. We should have you cured within the year. Brindee here will show you how to apply it with this aerosoled e-brush developed on the Space Station by Elon Musk's top engineers. And don't forget to tip your nurse!

That's what they're shooting for, you know. They want to fully monetize your every waking move. Pretty soon you will have to get a prescription, buy a license and insurance, and take six months of lessons in order to use a toothpick. Nail clipping will have its own period in public schools, grades one through twelve, and will be fully funded by taxdollars. Mowing the lawn will be a college elective, with its own federal department and cabinet secretary. It will be monitored onsite and in person by your HOA functionary, who will himself be under direct oversight of a pyramid of trained supervisors, robots, and CCTV cameras, as well as a private consortium of NGOs. It isn't only about the taxes, it is about the job creation!

It's also about the science, of course. They can't have you choosing your own toothpaste or hand lotion—what do you know about such things? Did you go to medical school? Are you a **scientist**? Hell no, so you shouldn't be so rash and narcissistic to think you can just jump in and make these health decisions. Leave that to the professionals, for crying out loud!

Come to think of it, the time for allowing people to walk willy-nilly into a market and just grab whatever is on the shelves should be a thing of the past. It seems downright selfish, not to say dangerous. In the near future the re-educated citizens won't believe it ever happened. You should obviously have to file for permission (and pay a government fee) for any purchase, to make sure you don't accidentally kill yourself or grandma.

Not to speak of the insurance that should guarantee and underwrite any of these actions. The re-educated citizens of the future will look back at this time in horror, to think that people were existing without full-spectrum liability and malpractice coverage. Someone is bound to make a mistake, even

with all the oversight in the world, and how is that going to be set right without a fully funded guarantee account?

\*In researching this paper, [I discovered the WHO is actually ramping up it's promotion of fluoride toothpaste](#) now, rather than scaling it back. Due to widespread mistrust, WHO added fluoride toothpaste to its **Model List of Essential Medicines** in 2021, in order to rebuild its public image. That's right, rat poison is now on WHO's list of essential medicines for your baby!

If you think there isn't enough fluoride in toothpaste to kill a rat, well, you would be wrong. You can kill rats with fluoride toothpaste. See [this youtube video](#) on how to poison rats using home ingredients. The list of ingredients: sugar, peanuts, flour, baking powder, and toothpaste. Hmm—*all* the things your kids are eating everyday. Which of those things is the poison in that list? Actually, they all are, but the other ingredients are just to make peanut butter cookies to draw the rats. The toothpaste is the poison. Why do you think it says on the tube to supervise young children, to be sure they don't swallow the toothpaste? [The large dose of baking powder doubles the whammy, giving them fatal indigestion as well as a fried brain. But the recipe calls for twice as much toothpaste as baking powder]. Amazingly, youtube has not taken that down. I guess Colgate think it will help them sell more toothpaste, since people are too stupid to figure this out.

Plus, if toothpaste and baking soda have some sort of doubling effect together, why do we put them together on purpose? Has anyone ever asked that question? Baking soda is a common additive for toothpaste, allegedly for the added grit. But maybe it was an accelerant of the poison all along?

If you have rats or mice, don't poison them. Get a cat, [or just use essential oils](#) like eucalyptus or peppermint on your kitchen baseboards. They hate that stuff.

If you have kids or teeth, don't use fluoride toothpaste. Use a natural poison-free alternative (also SLS free) or nothing. It is the brushing that is important, not the paste. My gums are way better than most people my age, still pink and not receding, and that is because I have never used these mainstream toothpastes. I also haven't had a soda since I was about 25 and I take VitC everyday. Also don't smoke.
